

INS Remote Backup Software works like regular data backup software, but with one important difference. Instead of sending backups to a tape drive or other media attached to the computer it is backing up, INS online backup software sends the backup over the Internet, regular telephone lines, or other network connections to your online backup server safely offsite. It does this (usually) at night while computers are not being used. Backups can also be done on-demand, any time. It is completely automatic. In fact, you may even forget it's working. Most businesses put their lives on the line every night and don't realize it. With businesses depending more and more on the data stored in their computers, proper backups are becoming much more critical.

INS Online Backup software accomplishes several essential steps that are often overlooked or done improperly by other backup software - especially in the regular non-automated backup systems.

Online Backups are done on schedule, reliably. Most businesses don't do this. For one reason or another, they don't keep a regular backup regimen. Usually it's because the person responsible for doing backups (if there is one) is too busy doing something else, or someone is using the computer when it's time for a backup, or they simply forget. Since remote backups are done with automated software usually at night, when nobody is using the computer, backups are always done on schedule.

INS Remote Backup Software encrypts its backups using your choice of eight of the strongest cryptographic methods in the world for complete security so nobody, not even the RBS Service Provider, can read the files.

Finally and most importantly - Backups are immediately sent offsite and stored safely away from the clients' computers and their businesses. This is where almost every business makes its biggest mistake. Even if they do everything else perfectly, backups are of little use if their building burns, or they are unable to physically recover their tapes from the premises. Most small companies who do backups leave the tapes in the building with the computer, where they can be destroyed right along with the computer. Of course, you can see that this would be a problem in a fire or flood or an earthquake. But it's also useful in emergencies where businesses are forced to evacuate their offices quickly. Even businesses that do backups and have good, undamaged tapes have to shut down. Many go out of business simply because they don't have access to their data. We solved this problem by automatically storing this valuable data at more than one site. So, a business can be back up and running with new computers and their latest data no matter what catastrophe happens.

Know what's going on with your data with detailed e-mail reports sent every time a backup is done. Here is a list of what the email will contain.

- Date of the backup
- Time of the backup
- User name Backup Set name
- Backup Set ID Number of files backed up
- Total file size of the backup
- Total disk space currently in use for all backups
- Percentage of quota currently used
- In the event of an error the email contains complete error information.
